Kerala floods: Blood pressure reduces as days pass, higher among males Kochi: The flood-affected people in Kerala have also reported a fall in blood pressure levels following the release of water from the Koscoil reservoir in the early hours of Sunday. "In my case, I could measure the fall in blood pressure after the release of water. I even informed my doctor about it," says a flood victim. The drop in blood pressure could be due to the relief they are getting from the release of water, but may also be due to the cooling effect of the water on the body temperature. "It seems like the flooding has reduced their blood pressure," said Dr PK Bhasin of the Prakash Hospital in Ernakulam. However, the decrease was higher in males. According to the results of the testing, conducted on 24 victims, 11 (46.88%) patients from the control group and 20 (83.33%) patients from the flood-affected group had a reduced blood pressure following the release of the water. Of these, 10 patients in the control group and 19 patients in the flood-affected group were males. "Though our data is limited, we suspect that with the lowering of temperature, the blood pressure decreases," said Dr Bhasin. However, the drop in blood pressure may not be significant. "For an adult, the fall in blood pressure is negligible and the change in blood pressure, before and after water release, may be minimal," Dr Bhasin told PTI. "It may be a drop in blood pressure that could be due to the 82157476af
